Hackathon Challenge ITADATA 2024: Predicting Customer Creditworthiness

Objective Level 2: The new test set is obtained by removing from the original test the last 2 periods known and we ask to make the prediction of the same period you did for challenge 1. So in practice you must use a reduced knowledge (n-2 period) to obtain the same prediction as before.

Add this to your code in a separated notebook or a clear separated section. At the end of the challenge both of the objectives will be evaluated separately.

You can use/modify/enhance the predictors built in the previous phase but not the knowledge from the periods missing in the new test set for the prediction of the users in this new challenge.
